**Supervisor: Nangendo Jacqueline**

**Report submitted in partial fulfillment for the award of degree in Mining  
engineering**

**May/2016**

## ACKNOWLEDGEMENTS

I would like to take this great opportunity with sincere gratitude to thank the Almighty God for seeing me through the four years at Busitema University and helping me accomplish this project successfully, He has done glorious and marvelous things to me, providing and always giving me all the things I desire. (Ephesians 3:20)

I also Appreciate my parents and family for their support mostly my brothers John Buyinza and Steven for their financial support in my academics. I also appreciate the following for their timely support in my life (Nassiwa Teddy, Winey, Josephine, Janet, Mwanje and all my relatives)

I also would like to appreciate my dear lecturers including my supervisor Miss. Nangendo Jacqueline, Mr. Kimera David, Mr. Tugume Wycliffe, Mr. Dumba L. Joseph and others for their academic contribution to the success of this project.

I as well appreciate all my friends, classmates and all others people who have contributed to the success of this project these including Busitema University, the government of Uganda and many more.

May God richly bless you according to his riches in glory (Ephesians 3:16)

## DEDICATION

I take this opportunity to dedicate this work to my father ***KATABAZI JOHN*** (R.I.P) and my mother ***NAKKAZI ROY*** (R.I.P). I will dearly miss them for the good and lovely things they did in my life.

**DECLARATION**

I **BYAKATONDA MARVINE** do hereby declare that the information and the work in this report has been prepared by me out of my knowledge and it has never been presented to any University or Institution.

**Date; .....**

## ABSTRACT

The usage of computer applications in the mining industry has become extensive though small scale mining companies have had challenges to access these softwares due to their high price and scarcity. This therefore called for the development of a software that can be used to select the best mining method, and determine rock supporting & ventilation requirements for underground mines since these are some of the key areas in mine design.

The mining method selection is based on Analytical Hierarchy Process (AHP) and University of British Columbia (UBC) methods for which the AHP method is preferred due to its versatility and flexibility. The rock supporting requirements are determined using Rock Mass Rating (RMR) and Q-system where RMR was preferred because it was giving detailed support requirements based on (Beiniawski, 1989) tables. The ventilation requirements are determined based on calculating the air flow requirements in the mine, this was based on air flow resistances in series and parallel circuits as well as depression and air quantity flow.

The software displayed excellent performance on windows 7, windows 8 & 8.1 and windows 10 both on 32 bit and 64 bit computers. Though there's need to include various tools and other factors that are desired in mine design to improve the scope and provide various fields to meet the users' needs. These including modelling rock failures, modelling air flows in underground mines and giving detailed analysis of the mining method selection process. There should also be an inclusion of a module that allows the user to print results to enable comprehensive record keeping.

Appendix g Sample Code from Visual Studio.....	62

# 1 CHAPTER 1: INTRODUCTION

## 1.0 BACKGROUND

From the days past, man's major aim has been to improve life and reduce manual labour. This called for the industrial revolution leading to development of various kinds of innovative and state of the art technology which has been implemented in the various fields of life ranging from daily, academic, scientific, industrial, business and other related kinds of activities including mining engineering. There has been incremental use of computers in the field of mining in the last three decades due to the continuous research and desire to exploit low grade deposits economically. (Erarslan, 2005)

Also the desire to improve mine safety and optimization of mine processes and activities has called for accurate, reliable and fast data processing systems. These systems have helped in simulating real world situations, solving difficult problems and analysis of mine data.

There are very many softwares that have been developed to deal with mine planning, designing, modelling, mine data storage etc., which big companies use in their mines to process data right from exploration to mine closure. (Wade, 1987) But these softwares have not been readily available to be used by the small scale miners due to their scarcity and price of purchasing them as well as technical support for the software usage in case they have bought them. This therefore calls for the design of a software, simple to use and cheap for small scale mining companies. (Erarslan, 2005)

## 1.1 PROBLEM STATEMENT

Due to scarcity & high costs of computer applications used in the mining industry, there is need to come up with a software that is cheap, reliable, accurate and user friendly to be used in selecting underground mining methods (Goldman, et al., 2014), determining rock supporting requirements and calculating ventilation requirements (parameters) for any given mine.
