

BUSITEMA UNIVERSITY

Faculty of Natural Resource and Environmental Sciences

Department of Natural Resource and Environmental economics

Contribution of biodiversity and ecosystem services protection on household and national economies: A case study of Mabira forest, Buikwe district, central Uganda

BY

MPANDE MAHAD KALYESUBULA

(REG NO: BU/UG/2010/228)

A report submitted to the department for consideration in partial fulfillment for the award of the degree of Bachelor in Natural Resource Economics of Busitema University

Supervisor: THEODORE MUNYULI (B.Sc.-Eng., M.Sc-*Envir.*, PhD)

Supervisor Title: Senior Lecturer

Academic year: 2012-2013

DECLARAT ION

I, **Mpande Mahad Kalyesubula**, do declare that the work presented herein is my own, except where it is acknowledged and that it has never been presented anywhere for the award of any degree or other certificate

Signature:.....

Candidate: Mpande Mahad Kalyesubula

Bachelor of Science in Natural Resource Economics

APPROVAL

This is to certify that this research was carried out under my supervision and approved as the student's original work.

Supervisor;

Signature :

A handwritten signature in blue ink, appearing to read 'Théodore Munyuli', is written over a dotted line. The signature is stylized and includes the year '1987' at the end.

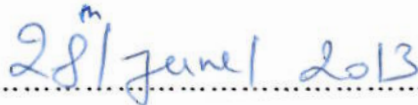

Théodore MUNYULI (B.Sc-Eng., M.Sc., Ph.D.)

(Senior Lecturer)

Department of Natural Resource Economics

Faculty of Natural Resources and Environmental Sciences

Date:

A handwritten date in blue ink, '28^m June 2013', is written over a dotted line.

DEDICATION

This work is dedicated to:

- My dear brothers and sisters,
- Eng. Dr. MUNYULI Théodore
- Academic Staff of the Faculty of Natural Resource and Environmental sciences
- Students at Namasagali Campus, mainly Mariam Nalunkuma, Lumu Ahmed Yusuf, Mpomwenda Verónica and Kagoya Esther.

Their encouragements and selfless sacrifice enabled me to accomplish this work in pursuing to obtain successfully my first university degree

ACKNOWLEDGMENTS

I wish to extend, in a special way, my sincere gratitude to my Supervisor **Dr. MUNYULI Théodore** and all other lecturers whose constructive criticisms, guidance and valuable comments enabled me to complete the dissertation.

I am very grateful to lecturers for providing to me with their personal academic books and materials without which the completion of this dissertation would have been undoubtedly difficult.

Special thanks to Associate Professor Isabirye Moses, Mr. Kakungulu Moses, and Mr. Kifumba David Nsajju and Mr. Taako Edema Gorge for all the assistance they rendered to me while writing this dissertation

I also wish to thank my dear friend Miss Kagoya Esther for assistance rendered to me throughout the NRE Course that led me to the writing of this dissertation.

I thank my brother Lumu Ahmed Yusuf and Sister Mariam Nalunkuuma for their prayers during the course of this study

It is not possible to mention all people whose contribution in one way or another has enabled me to complete this piece of work; suffice to note is that am sincerely grateful to all those who rendered their assistance to enable me accomplish this task.

ABSTRACT

A study was conducted to examine the contribution of biodiversity and the protection of ecosystems to the well-being of the people and the national economy at around Mabira forest in Buikwe District, central Uganda. Data collection consisted at assessing how people living in the forest make use of different biological species and the ecosystem services from the forest. Secondary data was obtained from literature in order to help the researcher understand better the topic. The study was of across sectional type. Both qualitative and quantitative approaches were applied to collect and analyze the data. Data was collected by conducting interviews using a questionnaire. The data was collected from a sample of 78 respondents. Data was analyzed using STATA (version 8), Excel and Minitab (version 15) while interested in carrying out descriptive statistics of the data. The results indicated a high economic value that forest plays in form of supporting life of species ranging from animals, birds and man himself. The ecosystem service such as the provision of fertility level were valued in terms of output from the agricultural land use by Maize; and was estimated to be worth US\$143360 ha⁻¹yr⁻¹. Hunting as another service was estimated to accounts for US\$935860ha⁻¹yr⁻¹. The results suggest that there is a need to invest in conservation of natural resources given the stream of benefits that underlie the forest and the lives that the forest supports in general. It was concluded that biodiversity and ecosystem services protection have a large contribution to the households as a major source of livelihood and to the national economy at large. It was recommended that adoption of prudent land-uses may help to protect the forest and the ecosystem services. Also, development goals by the government should take care of the sustainability issue with forest conservation in the region.

Keywords: *Mabira Forest, Biodiversity, Ecosystem services, Livelihoods, Valuation, central Uganda*

CHAPTER ONE: GENERAL INTRODUCTION

1.1 Introduction

The research looked at the contribution of biodiversity and the protection of ecosystems to households and national economy in Uganda using a case study of Mabira Forest in Najjembe sub county of Buikwe district. This chapter covers the background of the study, problem statement, Objectives, research questions, scope of the study, justification of the study, conceptual framework, key terms used and the organisation of the research.

1.2 Background of the study.

Biodiversity has been most generally defined as the "full variety of life on Earth"(Takaes, 1996). More specifically, biodiversity is the study of the processes that create and maintain variation. It is concerned with the variety of individuals within populations, the diversity of species within communities, and the range of ecological roles within ecosystems (Graham Bell, pers. comm.).

If this seems like a vague definition, that's because it is. There is no agreement on what exactly biodiversity means: It can refer to genetic diversity, to species diversity or to the diversity of environments or habitats. Some believe that it has simply replaced the terms "nature" or "wilderness" (Chadwick, 1993).

Furthermore, researchers and conservationists all employ a working definition of biodiversity shaped by their values, interests and goals. There is a great variety of human perception about what biodiversity is and, therefore, there are many different reasons why it important to conserve biological diversity (Biodiversity theory).

An ecosystem is a community of living organisms (plants, animals and microbes) in conjunction with the nonliving components of their environment (things like air, water and mineral soil), interacting as a system (Tansley 1934; Molles 1999). These biotic and abiotic components are regarded as linked together through nutrient cycles and energy flows(Odum 1971).

As ecosystems are defined by the network of interactions among organisms, and between organisms and their environment(Schulze et al 2005), they can come in any size but usually encompass specific, limited spaces(Chapin et al2002) (although some scientists say that the entire planet is an ecosystem) (Willis1997).
