A research proposal presented in partial fulfillment of the requirements for the award of the degree of bachelors of agricultural mechanization and irrigation engineering

May 2015

#### DECLARATION

I, SAKKA RONALD do hereby declare that this proposal report is my own original work and that; it has not been published and/or submitted for any academic award to any higher institution of learning. All the work contained in this report is as a result of my research except where cited.

i

SAKKA RONALD Date: 25 05 2015

BUSITEMA UNIVERSITY LIERARY CLASS No.

#### DEDICATION

I dedicate this project Report to BRIAN STEIN for the wonderful work done towards reaching this level of education. May the almighty God bless him abundantly.

ţ.,

I also dedicate it to my mum kayaga Rosette and Mr. Bazira Gerald for the sacrifices, time and courage you provided me which have enabled me to complete this course. Thank you for the spirit of hard work, courage and determination you have instilled in me throughout my school days until today.

e

,

#### ACKNOWLEDGEMENT

I am indebted to my dear brothers, sisters, relatives, classmates and friends to whom i extend my sincere appreciation for their guidance and support.

I extend my gratitude to all my Lecturers at the Faculty of Engineering, Agricultural Mechanization and Irrigation Engineering Department who have equipped me with academic knowledge that has guided me to succeed in my studies for the four academic years.

My thanks go to my supervisors Mr. Wilberforce Salanjaye and Mr.Godfrey Ssajja Ssali whose directions and guidance enabled me to successfully complete the project. Additionally, special regards goes to Dr. Wandera Catherine for the time offered during consultations, thank you so much.

I thank the almighty God for his grace, mercy, wisdom and protection.

#### ABSTRACT

Maize cob is one of the agricultural wastes from the maize crop; among others include maize stalk and leaves which are being used as a source of organic manute and at times as animal feeds. Maize cobs can be used as roughages that become available as livestock feeds after the crops have been harvested. Maize cobs have got some minerals and nutrient such as proteins, edible fibre, calcium, potassium, chlorine, cellulose and many others. In Uganda, the increase in the price of maize due to high demands and exportation to outside countries like Sudan, has resulted into high increase in the prices of animals feeds majorly maize bran hence making animal rearing very expensive. The aim of this study was to make use of the available nutrients and minerals found in a maize cob to supplement animal feeds. This was be attained through the design and construction of a maize cob milling machine powered by a motor. In achieving the above goal, basic engineering principles, physical and mechanical properties of maize cobs were considered in the design of the various components of the maize cob milling machine. The machine was designed basing on the crushing speed of maize cobs which ranges between 800 to 1400rpm, crushing force of 860N and crushing strength of 5.4MPa. Softwares such as solid edge, AutoCAD and Matlab were used in the design of the intended machine. The machine was fabricated from readily available materials and common production technologies, including cutting, bending, welding, drilling, milling and others. The maize cob milling machine was designed and constructed by first sizing of the components through analysis of forces acting on the components, material selection, fabricated and assembled. The selected materials were those which would withstand the applied forces in order to avoid failure of the components during operation of the machine. After the fabrication process the machine was tested for its performance,

A summary of the key findings included, the designed machine could be operated by at least a 3hp motor. The cost of prototype was UGX 600000 .After testing, the machine had a production capacity of 7kg/hr. of maize cobs with an average efficiency of 84%. The percentage loss was 16% .Provisions was provided to change the sieve in case certain sizes of maize cobs were required. The prototype had a limitation of producing a

lot of noise and dust when operating. Conclusions and recommendation about the project are also included in this report.

#### **CHAPTER I: INTRODUCTION**

This chapter underscores the importance cereal to man and animals as a food source and as a raw material for processing industries. The problem to be addressed in this study as well as the purpose and rationale of the study are provided in this chapter; the objectives and scope of the study are also clearly outlined.

#### **1.1 BACKGROUND OF THE STUDY**

Maize (Zea mays L,) a source of maize cob was domesticated over 6000 years ago in what is now Mexico, from a wild grass called teosinte. Maize is a monoic annual plant which belongs to maideas tribe and the grass family of gramineae it is originally a New World crop which was introduced in Uganda in 1861 and by 1900 was already an established crop. The World Bank estimates that there are about 1.3 million hectares of land suitable for maize production in Uganda, Main maize growing areas being the fertile soils around the northern periphery of Lake Victoria.

Maize was easily adopted because of its excellent storage properties if properly dried, it gives one of the highest yields per man-hour of labour spent on it, it provides nutrients in a compact form, it is easily transportable and the husks give protection against birds and rain, it is easy to harvest and hull, it does not break easily, it can be harvested over a long period, first as mature cobs, and can be left standing in the field for several weeks beyond physiological maturity. It can also be successfully inter-cropped with many other food crops and thus saves on land and cannot affect food security as it matures earlier than the other crops. (Djatköv, et al 2011)

Maize is used in homes, schools, institutions, hospitals and universities as a reliable source of food, it is also used in industries to manufacture oil in addition, it's a major energy source in poultry and livestock feeds. This poses a challenge as the quantity of grains available for the expanding human population in addition to animals is limited. Other factors complicating this include poor storage facilities and environmental factors like flooding which reduces the end quantity of cereals available for use as food and feed, leading to competition between humans and animals for grains. The overall result is a continuous rise in the market price of grains. The high cost of feed is reported to be
