*A final year project report submitted to the Department of Mining and  
Water Resources Engineering as a partial fulfillment of the requirements  
for the award of a Bachelor of Science degree in Water Resources  
Engineering.*

## **ABSTRACT**

Throughout the human history floods have been an integral part of the civilization. Still men have not quite coped well to live with floods. Flooding is the most frequent global natural disaster; rural areas are becoming more vulnerable to flooding due to effect of climate change. Flash flood is one of the most prominent phenomena caused by heavy rains. In developing countries drainage channels is the most common strategy employed for flood control. The failure of preventive measures has led to most authors and researchers to advocate a shift in thinking from preventive measures to flood risk and structural management measures. On the other hand, areas on the lee ward side of the mountain like Karamoja experience water scarcity and basing on the flooding conditions, this excess water causing flooding can be diverted. Recently, the advancement in computer-aided technology has been extensively used in formulating models used for flood calculation and hazard analysis. This study focuses on using a hydraulic model HEC-HMS and HEC-RAS in a GIS environment for the affected areas of Elgon zone i.e. Bulambuli and Kween, generates the inundation area and the return period for the specified flood events. The research involved studying various literatures and collecting data in form of journals and reports. This helped to formulate the methodology for the whole project.

It was followed by the modelling stage. This started with data collection from various sources i.e. from offices. Data collected included: - DEM, discharge flow data, land use/land cover data, rainfall data and soil data. These datasets were conditioned and processed in the GIS environment using the ArcGIS software. Land use and soil data was used to generate Curve number grid and later GeoHMS was used to set up a project which involved basin characteristics and processing and exported into HMS to generate hydrograph (peak discharges) to be used in the HECRAS. The GeoRAS file was exported to the HEC-RAS program to compute for a steady flow simulation. The RAS mapper export from HEC-RAS program was then imported in to ArcMap to delineate a flood plain map which was overlaid to a Google image to determine flood prone areas. The villages included among others like Chepsikunya, Ngenge, and along Mbale Moroto road. This was followed by design of the system components like pipes, reservoir tank, trapezoidal flood channel and sluice gates and there after simulating the flow in Epanet.

## DECLARATION

I, Adikin Helen, registration number BU/UP/2014/555 declare that the entirety of work contained in this project proposal is my original work except where explicit citations have been made.

Therefore, it has never been submitted to any institution of higher learning for any academic award.

Sign:  .....

Date: 1ST JUNE 2018 .....

**APPROVAL**

I affirm that Adikin Helen, registration number; BU/UP/2014/555 compiled this project proposal under my supervision, and it can be submitted to the University management for an academic award.

Mr. Oketcho Yoronimo

Main Supervisor

**DEDICATION**

This report is dedicated to my family and supervisor Mr. Maseruka S. Bendicto for the great guidance, constructive remarks and support rendered to me during the research and compilation of this report.

## **ACKNOWLEDGMENT**

I take this opportunity to convey my heartfelt gratitude to the following persons. With your tremendous support, I wouldn't have successfully written this report.

First and foremost I thank God for His protection and guidance. I wish to thank my supervisors Mr. Maseruka S. Bendicto and Mr. Oketcho Yoronimo for their immense academic and professional guidance

All lecturers of the department of mining and water resources Engineering, Busitema University without their guidance, insights, and lecture contributions, this project wouldn't have seen the light of the day. To my course mates Atim Christine rose and Kalule Jessy, your constructive criticism and encouragement was of immense help.

Finally to my beloved parents Mr. and Mrs. Godfrey and Jane Othieno, I greatly appreciate you for the moral and financial support. God bless you all abundantly and exceedingly.

3.7.2 Inputs .....	30

3.7.3 Outputs .....	31
3.7.4 Hydraulic Model Building.....	31
3.7.5 Hydraulic Geometry Considerations.....	31
3.7.6 HEC-GeoRAS Processing.....	31
3.7.7. Testing and Validating.....	33
CHAPTER FOUR; FINDINGS AND RESULTS .....	34
4.1 INTRODUCTION.....	34
4.2 METHODOLOGY ONE.....	34
4.2.1 Hydrologic modeling datasets .....	34
4.3.2 Meteorological data.....	34
4.3.3 Sub basins within the catchment area.....	35
4.3.4 Total discharge at Outlet from HEC_HMS.....	37
4.4.5 Pipe .....	37
4.4.6 Reservoir Capacity.....	37
4.4.7 Pump.....	37
4.4.8 Trapezoid channel flood design .....	38
4.4.9 Diversion Sluice Gate .....	38
4.2 OBJECTIVE TWO SIMULATION .....	39
4.2.1.Map Showing the Piping Network of the Diversion System.....	39
4.2.2. The Flow Network in Epanet.....	40
4.3. OBJECTIVE THREE TESTING AND VALIDATING.....	40
4.3.1 .....	40
4.3.2. The elevation profile of the network.....	41
4.3.3. HEC-RAS Model Setup & Inputs and results .....	41
4.2.3 The areas prone to flooding are shown below .....	42
4.2.4 Map Showing the Piping Network of the Diversion System.....	43
4.3.1 Table showing the different parameters such as velocity, friction factor, unit head loss and flow in each pipe.....	43
4.3.2 The elevation profile of the network.....	44
CHAPTER FIVE CONCLUSIONS, CHALLENGES AND RECOMMENDATIONS.....	45
5.1 CONCLUSIONS.....	45
5.1.1 Hydrological modelling .....	45
5.1.2 Hydraulic modelling 3 .....	45
5.2 CHALLENGES .....	45

5.3 RECOMMENDATIONS.....	46
REFERENCES.....	47

## **CHAPTER ONE**

### **1.1 BACKGROUND**

Water scarcity in Karamoja is still a very big challenge that needs great attention. The Karamoja region consists of seven districts in north eastern Uganda (Kaabong, Kotido, Abim, Moroto, Napak, Amudat, and Nakapiripirit). The region borders Kenya to the east, South Sudan to the north, and the districts of Kitgum, Pader, Lira/Agago, Amuria and Katakwi to the west, and Kumi, Sironko and Kapchorwa to the south. Overall population in Karamoja is estimated at about 1.2 million people, with about 70 percent residing in rural areas (Burns, Bekele, & Akabwai, 2013)

With more than 27,000 square kilometres, this arid expanse of savannah and bush forms the northeast edge of Uganda where it borders Kenya and the Sudan. To its east stands the Rift Valley escarpment towering over the Kenyan plains and scrubland. To the north lie the pristine basin of Kidepo National Park and also a mountainous vastness that leads into the Sudan. Similarly, to the south, there are the rugged peaks of Mount Elgon National Park. In the west, abundant swamps enter into the Acholilands. Karamoja is more than 1,000 metres above sea level, and four main mountains overlook the region's savannah, highlands and river valleys: Mount Morungole in the north, Mount Moroto in the east, Mount Kadam in the south and Mount Napak in the west (Profile, 2016).

In many areas, rains do not often exceed 800 millimetres per year, sometimes hovering around a mere 500 millimetres. The precipitation that does fall usually comes sporadically between June and October with the desert winds and the hot dry season taking over the land from November to March. Karamoja is an agro-pastoralist area; the economy is based on cattle herding: this is considered by the Karimojong to be the most sustainable type of livelihood in which they live, therefore water is needed adequately. Due to the climate change in this region, there has been drought that has led to the drying of rivers; water scarcity; transhumance, low productivity, decrease in the water table levels, high levels of evapo-transpiration in the valley dams and crops (Mubiru, 2010).

The water shortage has been attributed to the persistent dry spell that has affected the water table. About 4,000 people have migrated from their
