A Final Year Research Project Report submitted to the Department of Mining and Water Resources Engineering in Partial Fulfilment of the Requirement for the Award of a Bachelor of Science Degree in Mining Engineering.

DECEMBER 2020

ABSTRACT

Empirical design method relates practical experience gained on previous projects to the conditions anticipated at a proposed site and requires experience as well as engineering judgement. In the underground industry the classifications systems forms the basis of many empirical design methods, as well as the basis of failure criteria used in many numerical modeling programs.(Lateef, 2014).

Rock mass classification systems are an integral part of empirical tunnel design and have been successfully applied throughout the world as a unique method for design. Support is provided by structural members installed in the ground where they are anchored to mobilize support by resisting the stresses causing deformation or displacement. In designing the support system, it is necessary to know the direction and magnitude of rock pressure, and also, the strength of the rock around the or tunnel.

Nyamuliro Wolfram mine is located on 422 kilometres southwest of Kampala. It is located in Rubanda district, Kigezi region, in the south west part of Uganda, approximately 35km northwest of Kabale.

Accurate prediction of the support system and their properties to be applied in the tunnel excavated during mining is essential for reliable technical and financial planning. This is achieved through empirical determining of the support requirements and analyzing them using phase2 numerical software and the presentation of the results in a form that is accessible to the mine engineers. The support has been designed to maximize safety and productivity. The study was conducted basing on several analysis both from the field and laboratory to come up with the support requirements and design. The findings indicated that the rock mass for the ore body of Nyamuliro mine is Fair with a Uniaxial Compressive strength of 100MPa, the general rock quality being 52% and a rock mass rating of 42. The determined support requirements include shotcrete of 120 mm thick, with the mixing ratios of concrete of UCS value 30MPa, also rock bolts of 4.5m long.

DECLARATION

I NAMUYANJA LYDIA, BU/UG/2016/71, do declare that the work contained in this project proposal work is my original work except where explicit citations have been made. Therefore, it has never been submitted to any institution of higher learning for any academic award.

ACKNOWLEDGEMENT

Most importantly, I thank God for the gift of life He has offered to me to accomplish this project and gather all the necessary information to compile this report. My sincere appreciation goes to my supervisor Mr. TUGUME WYCLIFFE and all other lecturers for the for the guidance and time they sacrificed. I am greatly indebted to my mum; Miss NABATANZI ROSE, Brother ROBERT KYEYUNE and other family members. They have been there for me amidst all challenges. In

scarcity of resources, they have sacrificed their time, spared their advice and the very last of their property for me. Surely, there is nothing I can give to pay them other than praying for God's providence and blessings upon them. I also owe gratitude to my fellow students due to their unique trait of team work and cooperation and the necessary guidance they equipped me with during the compilation of this project.

Chapter one	1
1.0 INTRODUCTION	1
1.1 Back ground	1
1.2 Problem statement	2
1.3 OBJECTIVES	
3 Main objective	
.....	3
1.4 Significance of the research.	3
1.5 Scope and limitations.	
3 1.6 CASE STUDY AREA	
.....	3
CHAPTER TWO: LITERATURE REVIEW.	5
2.0 introduction	
5 2.1 Geological structures and discontinuity properties.	
.....	5
2.2 Definitions	
7	

2.3 Overview of the rock classifying systems	7
2.3.1 Rock Mass Rating (RMR) System	8
2.3.3 Rock Mass Quality (Q) System	
9 2.3.4 NATM (New Austrian tunneling method).....	10
2.4 tunnel design and Determination of support requirements	10
2.4.1 Tunnel designing.	10
2.4.2 Rock support	
11 2.4.3 CLASSIFICATION OF SUPPORTS	
.....	12
2.4 Numerical modelling.	13
2.4.1 Discontinuum Models	13
2.4.2 Continuum Models	14
2.4.3 Application of Finite Element Method for Tunnel Design	14
CHAPTER THREE: METHODOLOGY	16
3.0 Introduction	16
3.1 methodology for specific objective one: Classification of the rock mass	16
Data collection.....	16

3.1.1 Data collection methods	16
3.1.2 Equipment and tools used in the study	17
3.1.3 Data Collected	17
3.1.4 Data interpretation and analysis	18
3.2 Methodology for specific objective two: Determination of the support system for the main tunnel.	20
3.3 Methodology for specific objective three: To analyze and verify the empirically determined	20
CHAPTER FOUR: RESULTS ANALYSIS AND DESIGN	22
4.0 Introduction	22
4.1 Specific objective one was achieved in the following ways;	22
4.2 Objective 2. determining support requirements empirically.	23
4.3 Specific objective three: To analyze and verify the empirically determined support system.	26
CHAPTER FIVE: CONCLUSIONS AND RECOMMENDATIONS	36
5.1 CONCLUSIONS	36
5.2 RECOMMENDATIONS.	36
