

THE EFFECT OF PROBIOTICS (*Lysinibacillus fusiformis* LFUG) ON THE GROWTH PERFORMANCE AND SURVIVAL OF JUVENILE NILE TILAPIA (*Oreochromis niloticus*)

BY

**LOTA BRIAN**

**BU/UG/2020/0269**

A RESEARCH REPORT SUBMITTED TO THE FACULTY OF NATURAL RESOURCES AND ENVIRONMENTAL SCIENCES IN PARTIAL FILFULLMENT OF THE REQUIREMENT FOR THE AWARD OF A DEGREE IN BACHEROLORS OF SCIENCE IN FISHERIES AND WATER RESOURCES MANAGEMENT OF BUSITEMA UNIVERSITY.

FEBRUARY 2024

**DECLARATION**

I Lota Brian hereby declare that this is my own original work and has never been submitted to any other institution or University for the award of a degree.

Signature .....

Date.....

**APPROVAL**

This study was carried out under supervision and the report is now ready for submission with the approval of the following people.

1. Ms. Catherine Agoe (Field Supervisor)

Research Officer, Aquaculture Research and Development Center Kajjansi (ARDCK). P.O. Box,530, Kampala-Uganda.

Signature..... Date .....

2. Mr. Philip Rwezawula (PhD cand) (Academic Supervisor)

Lecturer, Faculty of Natural Resources and Environmental Sciences

Department of Fisheries and Water Resources Management, P.O. Box, 01 Kamuli, Uganda.

Signature..... Date.....

## **DEDICATION**

I dedicate this piece of work to my academic supervisor Mr. Philip Rwezawula, my field supervisor Ms. Catherine Agoe, my beloved mother Ms. Kauta Ruth, my Uncle Mr. Waweyo Charles, my brother Nzogi Paul, and to all my fellow classmates.

## **ACKNOWLEDGEMENT**

Glory be to the Almighty God who provided protection and guidance throughout my Research period.

I extend my sincere gratitude and heartfelt appreciation to my University supervisor Mr. Philip Rwezawula for his tireless efforts, guidance and mentorship throughout my Research project.

I would like to thank the Aquaculture Research and Development Centre- Kajjansi (ARDC) for giving me an opportunity to conduct my research at the Institute and a conducive environment for my experimental work.

Am very much grateful to my field supervisor Ms. Catherine Agoe for the necessary assistance and guidance throughout my Research experiment.

I would like also to acknowledge my Parents and my relatives for the continuous support towards my academic carrier.

Am so appreciative to my classmates for the good co-operation and teamwork throughout the course.

**May the Good Lord Bless You All**

## Abstract

Probiotics play a crucial role in improving the water quality, growth, and resistance of fish against pathogenic organisms. They have shown great potential for application in aquaculture and could be safer alternatives to antibiotics. The present study was conducted to evaluate the effect of *Lysinibacillus fusiformis* LFUG dietary inclusion on the growth performance and survival of juvenile *Oreochromis niloticus*, and on the physiochemical water quality parameters. Two different concentrations of the bacteria ( $1 \times 10^6$  (LFUGT1) and  $1 \times 10^8$  (LFUGT2) CFUml<sup>-g</sup>) were incorporated in a commercial diet (Koudijs) to make the experimental test diet whereas the negative control diet had no bacteria added (normal saline only). Nile tilapia juveniles of average body weight  $1.723 \pm 0.4$ g were subjected to the respective experimental diets for a period of fifty days with 10-day sampling intervals for weight (g), total length (cm) and standard length (cm). Fish fed on diets supplemented with the bacteria showed significantly better growth performance than those that were not (control) ( $P < 0.05$ ). Fish in the LFUGT2 treatments significantly added more weight ( $5.649 \pm 1.253$ ) than LFUGT1 ( $5.286 \pm 1.236$ ) the Control ( $4.407 \pm 1.817$ ) after the 50 days of feeding on the test diets. There wasn't any negative effect of the bacteria on the health of the fish fed on feeds enriched with the different concentrations since there was no significant difference in the survival rates as compared to the control. (Control -  $92.7 \pm 1.5\%$ , LFUGT1 -  $94.6 \pm 0.6\%$  and LFUGT2 -  $95.3 \pm 2.5\%$ ). Furthermore, the Ammonia, Nitrites and Nitrates were better controlled respectively in LFUGT2 ( $0.25 \pm 0.01$ mg/l,  $0.5 \pm 0.01$ mg/l and  $15 \pm 5$ mg/l) and LFUGTT1 ( $0.5 \pm 0.02$ mg/l,  $0.5 \pm 0.01$ mg/l and  $10 \pm 5$ mg/l) than that in the control treatment ( $1 \pm 0.02$ mg/l,  $0.6 \pm 0.02$ mg/l and  $20 \pm 5$ mg/l). Throughout the experiment, the mean temperature and dissolved Oxygen (DO) were (Temp  $26 \pm 0.5^\circ\text{C}$ ,  $26 \pm 0.2^\circ\text{C}$ , and  $26 \pm 0.4^\circ\text{C}$ , DO  $4.3$ mg/l,  $4.9$ mg/l and  $4.5$ mg/l) for control, LFUG T1 and LFUG T2 respectively. Therefore, *Lysinibacillus fusiformis* dietary inclusion at the two concentrations used in this study enhanced growth of juvenile Nile tilapia, improved water quality, and did not have any biosafety concerns for the 50 days of the experiment. Thus, the bacterium is a promising candidate for use in Nile tilapia fish farming as a probiotic.

## CHAPTER ONE: INTRODUCTION

### 1.1 Background

Aquaculture plays a critical role in meeting the increasing demand for fish protein worldwide (FAO, 2020). Globally, there is a growing demand for fish and fish products caused by the rapid population growth and the increased preference for the consumption of healthier foods (Sherif, A.H. (2023). Nile tilapia (*Oreochromis niloticus*) is one of the most widely cultured and produced species in freshwater aquaculture with global production reaching over 1.5 million metric tons (FAO, 2020). This is due to its rapid growth, high adaptability to various environments, good resistance to rough handling, and high nutritional value (FAO, 2020; El-Sayed, 2006). In Uganda Tilapia production has significantly increased over the past few years due to the adoption of semi-intensive and intensive aquaculture technologies. However, these farming systems have subjected the fish to stressful conditions that suppress their immunity, hence exposing them to various pathogens. Infectious diseases pose a significant challenge to tilapia aquaculture, resulting in substantial economic losses. According to Assefa & Abunna (2018), more than 50% of the overall losses in aquaculture is attributed to fish diseases. Besides, the global annual economic losses in aquaculture are estimated at approximately 9 billion USD (Novriadi, 2016). Conventional treatment methods for bacterial infections in aquaculture, such as the use of antibiotics and chemotherapeutics to enhance disease resistance, survival, and growth performance in aquaculture has been recently questioned. This is due to the emergence of antimicrobial resistant (AMR) strains that pose a serious threat to the environment and consumers of aquatic organisms (Cabello, 2006; Sørum, 2006). Hence, the need for alternative sustainable and safer approaches is warranted.

Probiotic, prebiotic, and symbiotic use in tilapia production is considered a viable, safe, and environmentally friendly alternative that enhances growth performance, feed utilization, immunity, disease resistance, and fish survival against pathogens and environmental stress (Vignesh. R *et al*, 2011). Probiotics are live microorganisms that confer health benefits when administered in adequate amounts through an appropriate route (Hill *et al.*, 2014). *Lysinibacillus fusiformis* is a bacterium that has shown strong antimicrobial properties against various pathogens and has also enhanced overall growth and health of fish (Santos *et al.*, 2016). Consequently, this research aimed at assessing the effect of probiotics on the growth performance and survival of juvenile Nile Tilapia, and on the physiochemical water quality parameters. This would contribute
